

E-23 §3.6 requirement	Simple meaning	What should you validate?	Result / evidence to produce
Monitoring frequency, scope & criteria	Define what will be monitored, how often, and what good/bad performance looks like.	Check whether monitoring frequency and depth are appropriate for the model risk rating and type.	Monitoring Framework Assessment
Quantitative measures	Monitor the model using numbers/performance metrics.	Recalculate relevant performance metrics and compare against thresholds.	Performance Monitoring Results
Qualitative assessment	Don't look only at statistics; check whether the model is still being used correctly.	Confirm the model remains within its approved purpose, scope and use.	Fit-for-Purpose Assessment
Changes in model performance	Identify when model performance gets worse.	Compare current performance with development/previous periods.	Performance Trend Analysis
Changes in model usage	Check whether the business is using the model differently.	Compare actual use against approved use.	Model Usage Assessment
Changes in input data	Input data can change over time.	Check distributions, missing values, quality, population changes and data drift.	Data Drift / Data Quality Report
External dependencies	Changes outside the model can affect it.	Review changes to data sources, systems, vendor components, libraries and versions.	Dependency Change Assessment

E-23 §3.6 requirement	Simple meaning	What should you validate?	Result / evidence to produce
Changes in what is being modelled	The underlying business/population/product can change.	Check for new products, customer characteristics, portfolio changes or other structural changes.	Population / Portfolio Change Analysis
Breach thresholds	Define when poor performance becomes an issue.	Check whether clear limits exist and whether breaches are identified correctly.	Threshold/Breach Assessment
Material model modification criteria	Define when a change is big enough to require formal model governance.	Review criteria for determining minor vs. material changes.	Material Change Assessment
Contingency plans	Have a backup plan if the model stops working.	Check what happens if the model is unavailable, performs poorly or fails.	Model Contingency Plan Assessment
Escalation procedures	Serious issues need to reach the right people quickly.	Check who receives breaches, when they are notified and what actions are required.	Escalation Process Assessment
AI/ML autonomous decisions	AI models may make decisions with limited human intervention.	Check controls around autonomous decisions and their monitoring.	AI/ML Monitoring Assessment
Autonomous re- parametrization	Some models can automatically change themselves.	Check how automatic parameter/model changes are identified, controlled and reviewed.	AI/ML Change- Control Results

E-23 §3.6 requirement	Simple meaning	What should you validate?	Result / evidence to produce
Model drift	Model behaviour can change over time.	Test data drift, concept/performance drift and stability where applicable.	Model Drift Analysis
Prompt issue reporting	Problems should not sit unnoticed.	Check whether issues are quickly communicated to appropriate stakeholders.	Issue/Escalation Evidence

Monitoring Framework Review → Performance Testing → Backtesting → Data/Population Drift → Usage Review → Dependency Review → Threshold/Breach Testing → AI/ML Drift Testing (if applicable) → Findings & Escalation → Overall Monitoring Conclusion.
